

which plant, and which asset, is quietly costing you the most — ranked against its peers

PRODUCT OVERVIEW

Maintenance cost sits in SAP. Reliability sits in the CMMS/reliability solutions. Benchmarks live in someone's spreadsheet, refreshed quarterly at best. By the time a reactive-cost problem shows up in a review, it's been compounding for months — and nobody can say cleanly which plant, which asset class, or which single KPI is actually driving it. MaintenanceX360 turns that same maintenance data you already have into a ranked, benchmarked answer, without a new reporting cycle, a new system, or a new habit for your engineers to learn. It sits on top of your existing SAP and CMMS/reliability solutions data — it doesn't replace work order management, parts inventory or technician scheduling. It's the benchmarking and KPI layer those systems don't give you.

Why It Matters

Shown: illustrative benchmarking, cost-breakdown and trend-detection views — reflects the kind of output MaintenanceX360 generates from your own KPI data.

Reactive Cost by Plant

Total Cost of Ownership

PM Ratio Trend — Flagged

Benchmark every plant against its peers

Not a filterable report you have to build yourself — an automatic ranked leaderboard across Global, Affiliate, Plant and Asset levels, with the real % gap between best and worst already calculated.

Catch the drift before it's a spike

Not a vague "AI detects anomalies" — a stated rule: flagged only once a KPI shows a persistent decline, so a real problem doesn't hide behind normal month-to-month noise.

Know what's dragging performance down

Most dashboards leave you to scan every metric yourself. A single rolled-up view names the one KPI hurting the fleet the most, so you know exactly where to point attention first.

Spot when replacement is masking as maintenance

Reactive cost weighed against reactive work hours exposes when spend is dominated by expensive replacements rather than planned, economical repair.

See risk before it costs you

Reliability and cost KPIs ranked by asset surface where performance is degrading, before it turns into a reactive work order.

See the full cost of ownership

Acquisition, operating, maintenance, disposal and production-loss cost tied to each asset — a rollup credible enough to sit in front of finance, not just the maintenance line item.

See which assets are actually the problem

Not a filtered list you have to sort through — every asset plotted by reliability and reactive cost, so the handful quietly consuming the budget stand out at a glance.

How It Works

1. Connect

SAP maintenance, cost and asset master data, mapped to your existing Global → Affiliate → Plant → Asset hierarchy. No new data entry.

2. Compute

KPI formulas configured to your plant's own inputs and standards, then run automatically across cost, reliability and work-management categories — set up per site by Ingenero engineers.

3. Compare

Every plant and asset ranked against its peers each month, with persistent drift flagged before it becomes next quarter's cost surge.

Tracks the same numbers your team already reports on — cost, reliability and schedule — automatically, every month.

AI Assistant

Ask your data a question

A chat interface over the KPI engine — ask in plain English and get an answer pulled from data already computed, not a new analysis.

"Which plant had the worst PM ratio last quarter?"

Plain-English "why" on every alert

When a KPI is flagged for persistent decline, a generated sentence explains what else moved with it — grounded in the same numbers, not a new diagnosis.

"PM Ratio down 3 months straight, alongside rising Reactive Cost."

Platform

SAP connectivity

Plug-and-play with plant maintenance (PM) data

Hierarchy rollups

Global/Affiliate/Plant/Asset views built from asset-level input

Benchmarking & favorites

Save and compare KPIs across plants and asset classes

Reports

Downloadable reports across the hierarchy

DELIVERY

Configured and validated by Ingenero engineers using your plant's SAP maintenance data.

FLEXIBILITY

Any asset hierarchy; selectable KPI set; configurable per affiliate and plant.

SCALE

Repeat plants reuse the KPI configuration, with no/minimal rework per site.
